

Check-up

Pelvis and breast

Detecting changes early minimises risk.

The aim of this check-up is the early detection of pathological changes in the uterus, cervix and breast tissue. Every year hundreds of thousands of women around the world get breast cancer. With early detection the risk of metastases can be significantly reduced and the chances of recovery increased. Even cervical cancer - one of the most common cancers among women - and tissue changes in the uterus can be detected early and treated with targeted examinations. Screening measures such as the PAP smear or an MRI scan of the pelvis allow the assessment of your own risk profile and rule out undetected tumorous changes.

That's something you can rely on.

Elements of the check-up:

Detailed female medical history, gynaecological physical examination, abdominal and transvaginal ultrasound scan, vaginal smear test (inter alia for HPV), MRI of both mammary glands (breast MRI), discussion of the findings, handover of images and medical report.

Feel good!

In the modern medneo diagnostics centres you will be looked after and examined in a friendly and competent manner. Our trained staff warmly greet you in our high quality and modern centres. Your time in our waiting lounge will seem shorter thanks to drinks, snacks and magazines. With the latest MRI devices with a 70 cm opening, as well as a feel-good lighting concept in the exam room, we make the examination as comfortable as possible for you.

The examination procedure

Preparation

After your friendly welcome, taking down of your personal information and explanatory meeting with the radiologist of your choice, you will be prepared for your examination. Using our feel-good lighting concept, you can choose your favourite colour for the exam room and you will then be given headphones to protect against the loud machine noises. These headphones can be used to listen to your favourite music during the examination. Our staff will accompany you throughout the entire exam and tell you about the individual stages of the examination. Administration of a contrast agent is required for this examination. Unlike conventional x-ray contrast agents, the contrast agents used by medneo contain no iodine and are instead made from gadolinium, so there are far fewer undesirable side effects. Your radiologist will give you detailed information on the risks and side effects before the start of the exam.

Discussion of findings

Your radiologist examines the images after the exam. After the exam, both the written findings and MRI images are sent to you or your referring doctor, or to the specialist providing further treatment. Your gynaecologist will then have a final consultation with you after the exam. If required, we will gladly refer you to further specialists and provide you with an interpreter during the entire examination and discussion of the findings.

Making an appointment

You can make an appointment directly at one of our centrally located medneo centres.

medneo's extra long opening hours allow the partner practices and radiologists involved to offer flexible and timely appointments for your examination.

Please bring to the exam:

Previous findings

Previous images

Surgery reports

Implant certificates

Laboratory tests (creatinine)
